# 1 Introduction

## ① TCK837

TCK837 Is a light and delicate printer, in line with many industry bills and cashier printing. Low power consumption, high quality, stable performance, motor and thermal printing head after countless tests to achieve high standards, printer support U?{, internet access,?qH? Interface, can be external money box control interface, convenient and fast, practical wide.

List of supported operating systems :

WINDOWS XP

WINDOWS 7 32/64

WINDOWS 8

UBUNTU 12 32/64.04

UBUNTU 14 32/64.04

## ② main features

Step (delicate and beautiful

S(support U?{(Or network port) WIq I.?qH ?. Cloud printing

T (cassette control interface

Upper (low-noise, high-quality printing

Self (convenient and quick on the paper way

? (Easy to use and maintenance

T (Support for continuous paper printing

8) Compatible with multiple width paper

9) Printing speed is 180mm / s

## 2 Interface definition

### ① POWER

Power pin definition (24v model) :

Pin number	Signal name
1	VIN (+24V)
2	GN D

### ② pin definition of the cassette interface

Pin number	Signal name	Direction
1	FG	case
2	DRAWER 1	Monketbox 1 drive signal
3	DRSW	Cassette status monitoring signal
4	V DR	Cash te drive power supply
5	DR AWER 2	Monketbox 2 drive signal
6	GN D	Circuit common ground

### ③ USB Interface pin definition (Type B-USB)

Pin number	Signal name	Direction
1	VB US	+5V
2	D-	Data Line (D -)
3	D+	Data Line (D +)
4	GN D	Groun d

#### ④ Ethernet interface pin definition

Pin number	Signal name
1	TX +
2	TX -
3	RX +
4	n /c
5	n /c
6	RX -
7	n /c
8	n /c

### 3 Technical specifications

Print way	Line-type thermal printing
Print paper wide	80mm
print span	72m m
resolution ratio	203DPI
Number of points per line	384 Points
print out rate	100mm/s
Printable content	GBK Chinese character library, ASCII characters, one-dimensional bar code, support different density dot map, grating bit map and download bitmap printing. Expsible 2 D barcode.
Default font	9X 24 (ASCII), 24x24 (Chinese)
Barcode type	UPC -A , UPC -E , EAN 13,EAN 8,Code 39, Codebar,Code 93 , ITF , CODAB , Code 128 , UCC/EAN128
working voltage	24V

### 4 List of instructions

LF	Print hand in hand paper	Print and paper-feeding instructions
CR	carriage return	
ESC J	Print and paper n points	
ESC d	Print into the paper n line	
ESC 3	Set the row spacing to be the n points	

TCK837 Printer specifications

ESC 2	Set the row spacing as the default value	Print the setup instructions
ESC \$	Set up the print location	
G S L nL nH	Set the blank amount on the left side	
ES C SP n	Set the character right spacing	

ESC !	Set up the character print mode	
ESC M n	Choose the type	
GS !n	Set the character size	
G S B n	Set, unthe white printing	
ESC - n	Set, ununderline	
ESC V n	Set, remove 90° rotary printing	
ESC E n	Set, remove bold printing	
ESC G n	Set up and remove the overlapping printing	
ESC { n	Set, unreverse printing	
ESC a	Set up the print-out alignment mode	
FS &	Set the Chinese character mode	
FS ! n	Set up the Chinese character printing mode combination	
FS .	Cancel the Chinese character mode	
ESC % n	Select, and cancel the user-custom character set	
ESC &	Define a user-custom character set	
ESC ?n	Cancel the user custom character	
ESC R n	Select the international character set	
ESC t n	Select the character code page	
ESC 9 n	Switch over the two-byte encoding	
ESC *	Figure vertical die-taking data filling	
GS v 0	Picture horizontal mold data printing	
GS *	Define the lower bitmap	Graphic print instructions
GS /m	Print the lower bitmap	
FS q	Define the NV bitmap	
FS p n m	Print out the NV bitmap	
GS v 0 m	Print the grating bitmap	
GS n	Horizontal position print line segment (curve printing command)	
HT	horizontal tabulation	
ESC D	Set up the horizontal tabulation position	
GS H	Set the one-dimensional barcode-readable character (HRI) print location	One-dimensional barcode printing instructions
GS h	Set the one-dimensional barcode height	
GS w	Sets the one-dimensional barcode width	
GS k	Print a one-dimensional barcode	
GS k	Print QR code	
US Q	Dual-QR code printing	
GS ( k	PDF 417 Set the number of columns in the data area	

TCK837 Printer specifications

GS (k pL pH cn fn n	Set the module type of the QR code	QR code printing instructions
GS (k pL pH cn fn n	Set the error correction level error of the QR code	
GS (k pL pH cn fn m d1...dk	Store the data of the QR code to the QR code buffer	
GS (k pL pH cn	Print the QR code	

fn m		
GS (k pL pH cn fn m	Set up the graphics information for the QR code	
G S r n	Transfer state	State instructions
D LE EOT n	Real-time transfer status	
DLE ENQ n	Live printer request	
GS a n	Allow and prohibit automatic status reply (ASB)	
ESC @	Initialize the printer	Other instructions
DC 2 T	Print self-test pages	
ESC 7	Set the print concentration	
GS V	Select the cutting mode and cut the paper	
ESC i	Fully cut paper form (OnlyForCut)	
ESC m	Half-cut paper paper (OnlyForCut)	
ESC p m	Generate a wallet pulse	
F F	Print and return to standard mode (in page mode)	Page mode instruction
CAN	Unprint the data in page mode	
ESC FF	Print in page mode	
ESC L	Select Page Mode	
ESC S	Select the standard mode	
ESC T n	Select the print area direction in page mode	
ESC W	Set up the print area in page mode	
GS \$	Set the longitudinal absolute position in page mode	
GS \	Set the longitudinal relative position in page mode	
GS P	Set up the lateral and longitudinal moving units	

## 5 Instructions detailed explanation

### ① Print and paper-feeding instructions

#### print hand in hand paper

Directive name	Print hand in hand paper
instruction code	ASCII : LF Decal : 10 Hex-decimal system : 0A
functional description	Print the content in the print cache, then set the paper line according to the current line spacing, and adjust the print position to the starting position of the next line
Parameter range	not have

TCK837 Printer specifications

Windows default	not have
Support model	All models
matters need attention	not have
Use the example	not have

## carriage return

Directive name	carriage return
instruction code	ASCII : CR Decimal system: 13 Hex system: 0D
functional description	LF when the print cache is not empty, otherwise
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	
Use the example	not have

## print and paper n points

Directive name	Print and paper n points
instruction code	ASCII : ESC J n Decimal system: 2,774 n Hex-decimal system: 1B 4A n
functional description	Print the content in the print cache into the paper n point
Parameter range	$0 \leq n \leq 255$
Windows default	not have
Support model	All models
matters need attention	When the print cache is empty, only n paper After this instruction is executed, the print position moves to the starting position of the next line
Use the example	1b 40 30 31 32 1b 4a 10

## print into the paper n line

Directive name	Print into the paper n line
instruction code	ASCII : ESC d n Decimal system: 27,100 n Hex-decimal system: 1B 64 n
functional description	Print the content in the print cache into the paper n line
Parameter	$0 \leq n \leq 255$

range	
Windows default	not have
Support model	All models
matters need attention	The command sets the print start position as the line starting point
Use the example	1b 40 30 31 32 1b 64 01

## ② Print the setting instructions

set the rows with a spacing of n points

Directive name	Set the row spacing to be the n points
instruction code	ASCII : ESC 3 n

	Decimal system: 2,751 n Hex-decimal system: 1B 33 n
functional description	Set the row spacing to be the n points
Parameter range	$0 \leq n \leq 255$
Windows default	n = 33
Support model	All models
matters need attention	<p>The line spacing is shown as follows:</p>  <p>If the set row spacing is less than the maximum character height in a line, then the row spacing is equal to the maximum character height</p> <p>If ESC 2, ESC @, printer reset, printer power off, the line spacing is restored to the default value</p>
Use the example	<pre>1b 40 1b 33 60 30 31 32 0d 0a 30 31 32 0d 0a 1b 32 30 31 32 0d 0a 30 31 32 0d 0a</pre>

### set the row spacing as the default value

Directive name	Set the row spacing as the default value
instruction code	ASCII : ESC 2 Decimal system: 2,750 Hex system: 1B 32
functional description	Set the row spacing to the default 33 points
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	<p>Line spacing indicates detailed ESC 3 instructions</p> <p>If the set row spacing is less than the maximum character height in a line, then the row spacing is equal to the maximum character height</p> <p>You can customize the row spacing using ESC 3</p>

Use the example	not have
-----------------	----------

## set up the print location

Directive name	Set up the print location
instruction code	ASCII : ESC \$ nL nH Decimal : 2,736 nLnH Hex-decimal system : 1B 24 nL nH
functional description	Adjust the print position to the point of (nL + nH 256) away from the print start position

Parameter range	$0 \leq nL \leq 255$ , $0 \leq nH \leq 255$
Windows default	not have
Support model	All models
matters need attention	This instruction is only valid for the bank, and the printing position is reset after the starting position is moved to the next line
Use the example	1b 40 1b 24 08 00 30 31 32 0d 0a 30 31 32 0d 0a

### set the blank amount on the left side

Directive name	Set up the print location
instruction code	ASCII : GS L nL nH Decimal: 2,976 nLnH Hex-decimal system: 1D 4C nL nH
functional description	Set the left blank amount as the $(nL + nH \cdot 256)$ point
Parameter range	$0 \leq nL \leq 255$ , $0 \leq nH \leq 255$
Windows default	not have
Support model	All models
matters need attention	<p>This command is valid only when processed at the starting position of a row.</p> <p>The legend is shown as follows:</p> <p>If the setting is beyond the printable range, then the maximum printable unit is used</p>
Use the example	1b 40 1d 4c 30 00 30 31 32 0d 0a 30 31 32 0d 0a

### set the character right spacing

Directive name	Set the character right spacing
----------------	---------------------------------

## TCK837 Printer specifications

instruction code	ASCII : ESC SP n Decimal system: 2,732 n Hex-decimal system: 1B 20 n
functional description	Set the spacing to the right side of the character to [n 0.125 mm].
Parameter range	$0 \leq n \leq 255$
Windows default	0
Support model	All models
matters need attention	<p>For the width mode, the right character spacing is twice the normal mode. When characters are magnified, the right character spacing is n times that in general mode.</p> <p>This command does not affect the setting of the Chinese characters.</p>

Use the example	<p>1B 40</p> <p>1B 20 18</p> <p>30 31 32 0D 0A</p>
-----------------	--

### choose the type

Directive name	Choose the type								
instruction code	<p>ASCII : ESC M n</p> <p>Decimal system: 2,777 n</p> <p>Hex-decimal system: 1b 4d n</p>								
functional description	<table border="1"> <tr> <td colspan="2">Select the character type</td> </tr> <tr> <td>n</td> <td>function</td> </tr> <tr> <td>0, 48</td> <td>Select the type A (1224).</td> </tr> <tr> <td>1, 49</td> <td>Select the type B (924).</td> </tr> </table>	Select the character type		n	function	0, 48	Select the type A (1224).	1, 49	Select the type B (924).
Select the character type									
n	function								
0, 48	Select the type A (1224).								
1, 49	Select the type B (924).								
Parameter range	n = 0, 1								
Windows default	n = 0								
Support model	Part of the model								
matters need attention	<ul style="list-style-type: none"> <li>• ESC ! You can also choose the font type. But the setting of the last received command is valid.</li> </ul>								
Use the example	<p>1b 40</p> <p>1b 4d 00</p> <p>30 31 32 0d 0a</p> <p>1b 4d 01</p> <p>30 31 32 0d 0a</p>								

### set up the character print mode

Directive name	Set up the character print mode
instruction code	<p>ASCII : ESC !n</p> <p>Decimal system: 2,733 n</p> <p>Hex-decimal system: 1B 21 n</p>
functional description	<p>Set how characters print (font, antiwhite, inverted, bold, height, width, and underline)</p> <p>, The bit of the parameter n</p> <p>Definition is as follows:</p> <p><b>Bit functionvalue</b></p> <p><b>0 1</b></p> <p>0-type normal small print</p> <p>1 Undefined</p> <p>2 Undefined</p> <p>3 Bold unset</p> <p>4 times high to cancel the setting</p> <p>5 times width unsetting</p> <p>6. Undefined</p>

TCK837 Printer specifications

	7 Underline unset
Parameter range	not have
Windows default	n = 0

Support model	All models
matters need attention	This instruction is valid for both Chinese font and foreign language fonts When ESC @, printer reset, power failure, this instruction setting failure
Use the example	1B 40 1B 21 01 30 31 32 0D 0A 1B 40 1B 21 02 30 31 32 0D 0A 1B 40 1B 21 04 30 31 32 0D 0A 1B 40 1B 21 08 30 31 32 0D 0A 1B 40 1B 21 10 30 31 32 0D 0A 1B 40 1B 21 20 30 31 32 0D 0A 1B 40 1B 21 40 30 31 32 0D 0A 1B 40 1B 21 80 30 31 32 0D 0A

### set the character size

Directive name	Set the character size							
instruction code	ASCII : GS ln Decimal system: 2,933 n Hex-decimal system: 1d 21 n							
functional description	Set the character size to 1-8 times width and 1-8 x height Definition is as follows: Set the character height with 0 to 3 bits 4 to 7 bits as below							
	Table 1 character width setting				Table2 character height setting			
	hexadecimal	decimal system	width		hexadecimal	decimal system	width	
	00	0	1 (Ordinary)		00	0	1 (Ordinary)	
	10	16	2 (Multiwidth)		01	1	2 (Double height)	
	20	32	3		02	2	3	
	30	48	4		03	3	4	
	40	64	5		04	4	5	
	50	80	6		05	5	6	
	60	96	7		06	6	7	
70	112	8		07	7	8		
Parameter range	not have							
Windows default	n = 0							
Support	All models							

TCK837 Printer specifications

model	
matters need attention	<p>This instruction is valid for both Chinese and foreign characters except HRI characters</p> <p>When ESC @, printer reset, power failure, this instruction setting failure</p>
Use the example	<pre>1b 40 1d 21 11 30 31 32 0d 0a 30 31 32 0d 0a</pre>

## set, unthe white printing

Directive name	Set, unthe white printing
instruction code	ASCII : GS B n Decimal system: 2,966 n Hex-decimal system: 1d 42 n
functional description	Set or remove the antiwhite print mode. The antiwhite mode closes when the lowest effective bit of n is 0. When the lowest effective bit of n is 1, the anti-white mode is turned on.
Parameter range	not have
Windows default	n = 0
Support model	All models
matters need attention	Only the lowest bit of n is valid. The command is valid for both built-in characters and user-defined characters. When the antiwhite mode is on, it also works against the ESC SP set blank. This command does not affect bitmaps, user-defined bitmaps, barcodes, HRI characters, and space skipped by HT, ESC \$. The command does not affect the line spacing.  The antiwhite mode is preferred over the underlined mode. When the antiwhite mode is set, even the underlined mode is disabled (but not cancelled). When ESC @, printer reset, power failure, this instruction setting failure
Use the example	1b 40 1d 42 01 30 31 32 0d 0a 30 31 32 0d 0a

## set, ununderline

Directive name	Set, ununderline				
instruction code	ASCII : ESC - n Decimal system: 2,745 n Hex-decimal system: 1B 2D n				
functional	Set / remove the underline mode based on the following n value :				
	<table border="1"> <thead> <tr> <th>n</th> <th>function</th> </tr> </thead> <tbody> <tr> <td>0, 48</td> <td>Remove the underline mode</td> </tr> </tbody> </table>	n	function	0, 48	Remove the underline mode
	n	function			
0, 48	Remove the underline mode				

TCK837 Printer specifications

description	1, 49	Set the underline mode (1 point thick)	
	2, 50	Set the underline mode (2 points thick)	
Parameter range	$0 \leq n \leq 2, 48 \leq n \leq 50$		
Windows default	$n = 0$		
Support model	All models		
matters need attention	<p>The printer can underline all characters (including the interval to the right of the characters), except for blanks set by HT.</p> <p>The printer cannot print underlines the <math>90^\circ</math> characters and antiwhite characters clockwise.</p>		

	<p>When the underlined mode is lifted by setting a value of n to 0 or 48, the subsequent data is not printed underlined, and the roughness of the underline set before removing the underlined mode does not change. The default underlined bold degree is 1 point.</p> <p>Changing the character size does not affect the thickness of the current underscore.</p> <p>make use of ESC! You can also set or remove the underlined mode. Note, however, that the final command received is valid.</p>
Use the example	<pre>1b 40 1b 2d 01 30 31 32 0d 0a 1b 40 1b 2d 02 30 31 32 0d 0a 1b 40 1b 2d 00 30 31 32 0d 0a</pre>

### set, remove 90° rotary printing

Directive name	Set, remove clockwise 90° rotation printing
instruction code	<p>ASCII : ESC V n</p> <p>Decimal system: 2,786 n</p> <p>Hex-decimal system: 1B 56 n</p>
functional description	<p>Set or remove the 90° spin printing.</p> <p>Release the 90° spin print when n equals 0 or 48.</p> <p>When n is equal to 1 or 49, set the 90° spin print.</p>
Parameter range	$0 \leq n \leq 1, 48 \leq n \leq 49$
Windows default	n = 0
Support model	All models
matters need attention	<p>When the underline mode is set, the printer does not underline for characters that rotate 90° clockwise.</p> <p>In the clockwise 90° rotation mode, the height and width command amplify the characters in the opposite direction to the height width command character in the general mode.</p> <p>When ESC @, printer reset, power failure, this instruction setting failure</p>
Use the example	<pre>1b 40 1b 56 01 30 31 32 0d 0a 30 31 32 0d 0a</pre>

### set, remove bold printing

Directive name	Set, remove bold printing
----------------	---------------------------

## TCK837 Printer specifications

instruction code	ASCII : ESC E n Decimal system: 2,769 n Hex-decimal system: 1B 45 n
functional description	Set up or remove the bold print mode. Remove the bold print mode when the lowest effective bits of n is 0. Bold print mode is set when the lowest effective bit of n is 1.
Parameter range	$0 \leq n \leq 255$
Windows default	n = 0

Support model	All models
matters need attention	<p>Only the lowest effective bit of n is allowed</p> <p>This command and the ESC! Set and remove the bold print mode in the same manner. When this command and the ESC! Use it at the same time, and be careful.</p> <p>When ESC @, printer reset, power failure, this instruction setting failure</p>
Use the example	<pre>1b 40 1b 45 01 30 31 32 0d 0a 1b 40 1b 45 00 30 31 32 0d 0a 1b 40 1b 45 01 B 0 AE C 9 CF D 7 D4 BC BA OD OA 1b 40 1b 45 00 B 0 AE C 9 CF D 7 D4 BC BA OD OA</pre>

### set up and remove the overlapping printing

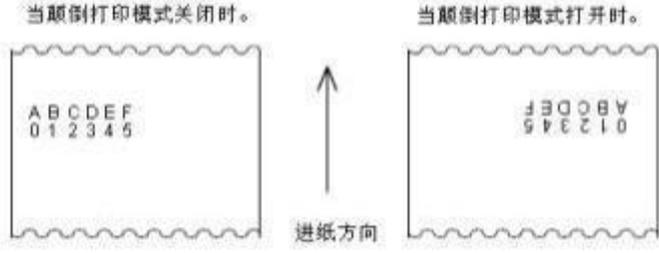

Directive name	Set up and remove the overlapping printing
instruction code	<p>ASCII : ESC G n</p> <p>Decimal system: 2,771 n</p> <p>Hex-decimal system: 1B 47 n</p>
functional description	<p>Set or remove overlapping printing mode.</p> <p>Remove the overlapping print mode when the lowest effective bit of n is 0.</p> <p>The overlapping print mode is set when the lowest effective bit of n is 1.</p>
Parameter range	$0 \leq n \leq 255$
Windows default	n = 0
Support model	All models
matters need attention	<p>Only the lowest effective bit of n is allowed.</p> <p>Printer output is the same in overlapping mode and bold mode.</p> <p>When ESC @, printer reset, power failure, this instruction setting failure</p>
Use the example	<pre>1b 40 1b 47 00 30 31 32 0d 0a 1b 40 1b 47 01 30 31 32 0d 0a 1b 40 1b 47 01 B 0 AE C 9 CF D 7 D4 BC BA OD OA</pre>

### set, unreverse printing

Directive name	Set, unreverse printing
----------------	-------------------------

## TCK837 Printer specifications

instruction code	ASCII : ESC { n Decimal system: 27, 123 n Hex-decimal system: 1B 7B n
functional description	Set or remove reverse print mode. Close the reverse print mode when the lowest effective bit of n is 0. Open the reverse print mode when the lowest effective bit of n is 1.

	
Parameter range	$0 \leq n \leq 255$
Windows default	$n = 0$
Support model	All models
matters need attention	<p>Only the lowest bit of <math>n</math> is valid.</p> <p>This command is only valid when entered at the start of a row in the standard mode.</p> <p>In reverse printing mode, the printer rotates the row to print by <math>180^\circ</math> before printing. When ESC @, printer reset, power failure, this instruction setting failure</p>
Use the example	<pre>1b 40 1b 7b 00 30 31 32 0d 0a 1b 40 1b 7b 01 30 31 32 0d 0a 1b 40 1b 7b 01 B 0 AE C 9 CF D 7 D4 BC BA OD OA</pre>

### set up the print-out alignment mode

Directive name	Set the print alignment mode (left, center, right)
instruction code	<p>ASCII : ESC a n</p> <p>Decimal system: 2,797 n</p> <p>Hex-decimal system: 1B 61 n</p>
functional description	<p>All the data in a row are aligned, and the value of <math>n</math> is significant as follows:</p> <p><math>n</math> pattern</p> <p>0, In the left</p> <p>48 1, between two parties</p> <p>49 2, On the right</p> <p>50</p>
Parameter range	$0 n 2$ or $48 n 50$
Windows default	$n = 0$
Support model	All models
matters need	When ESC @, printer reset, power failure, this instruction

TCK837 Printer specifications

attention	setting failure
Use the example	1B 40 1B 61 02 30 31 32 0D 0A 1B 40 1B 61 01 30 31 32 0D 0A 1B 40 1B 61 00 30 31 32 0D 0A

## set the chinese character mode

Directive name	Set the Chinese character mode
instruction code	ASCII : FS & Decimal system: 2,838 Xhex system: 1C 26
functional description	Select the Chinese character mode
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	When selecting Chinese character mode, the printer processes all Chinese character codes, two bytes at a time. Process the Chinese character code in the order of the first byte and the second byte.
Use the example	1b 40 1C 26 B0 AE C9 CF D7 D4 BC BA 0d 0a 1C 2E B0 AE C9 CF D7 D4 BC BA 0d 0a

## set up the chinese character printing mode combination

Directive name	Set up the Chinese character printing mode combination																																						
instruction code	ASCII : FS !n Decimal system: 2,833 n Hex-decimal system: 1C 21 n																																						
functional description	Set up the Chinese character printing mode																																						
Parameter range	$0 \leq n \leq 255$																																						
Windows default	0																																						
Support model	All models																																						
matters need attention	<table border="1"> <thead> <tr> <th>Position</th> <th>Close / open</th> <th>sixteen radix</th> <th>Decimal</th> <th>ASB status</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>—</td> <td>—</td> <td>—</td> <td>undefinition.</td> </tr> <tr> <td>1</td> <td>—</td> <td>—</td> <td>—</td> <td>undefinition.</td> </tr> <tr> <td rowspan="2">2</td> <td>close</td> <td>00</td> <td>0</td> <td>The width mode is prohibited.</td> </tr> <tr> <td>open</td> <td>04</td> <td>4</td> <td>Allow width mode.</td> </tr> <tr> <td rowspan="2">3</td> <td>close</td> <td>00</td> <td>0</td> <td>Prohibit the height mode.</td> </tr> <tr> <td>open</td> <td>08</td> <td>8</td> <td>Allow a fold-height mode.</td> </tr> <tr> <td>4</td> <td>—</td> <td>—</td> <td>—</td> <td>undefinition.</td> </tr> </tbody> </table>	Position	Close / open	sixteen radix	Decimal	ASB status	0	—	—	—	undefinition.	1	—	—	—	undefinition.	2	close	00	0	The width mode is prohibited.	open	04	4	Allow width mode.	3	close	00	0	Prohibit the height mode.	open	08	8	Allow a fold-height mode.	4	—	—	—	undefinition.

0	—	—	—	undefinition.																																			
1	—	—	—	undefinition.																																			
2	close	00	0	The width mode is prohibited.																																			
	open	04	4	Allow width mode.																																			
3	close	00	0	Prohibit the height mode.																																			
	open	08	8	Allow a fold-height mode.																																			
4	—	—	—	undefinition.																																			

TCK837 Printer specifications

	5	—	—	—	undefinition.
	6	—	—	—	undefinition.
	7	close	00	0	Prohibit the underlined mode.
		open	80	128	Allow an underlined mode.
<p>When the Chinese character mode is not selected, all character codes are processed as ASCII codes, one character at a time.</p> <p>When both width mode and height mode are set (including the right and left character spacing), four times sized characters are printed.</p>					

	<p>The printer can underline all the characters (including the right and left character spacing), but cannot underline the space set by the HT command and rotate the characters 90° clockwise.</p> <p>When some characters in a line are doubled up or higher, all the characters in the line are aligned along the baseline.</p> <p>The GS system can be used! The command roughwritten Chinese characters, the last command is valid.</p>
Use the example	<pre>1b 40 1C 26 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 00 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 01 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 02 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 04 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 08 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 10 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 20 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 40 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 21 80 B0 AE C 9 CF D 7 D 4 BC BA 0D 0A 1C 2E B0 AE C 9 CF D 7 D 4 BC BA 0D 0A</pre>

### cancel the chinese character mode

Directive name	Cancel the Chinese character mode
instruction code	<p>ASCII : FS .</p> <p>Decimal system: 2,846</p> <p>Hex system: 1C 2E</p>
functional description	Cancel the Chinese character mode
Parameter range	not have
Windows default	not have
Support model	All models

TCK837 Printer specifications

matters need attention	When the Chinese character mode is not selected, all character codes are processed as ASCII codes, one character at a time.
Use the example	not have

## select, and cancel the user-custom character set

Directive name	Select or cancel the user-defined character set
instruction code	ASCII : ESC % n Decimal system: 2,737 n Hex-decimal system: 1B 25 n
functional description	Select or cancel the user-defined character set Cancel user custom character set when the lowest valid bit of n is 0. Select the user-custom character set when the lowest valid bit of n is 1.
Parameter range	$0 \leq n \leq 255$
Windows default	0
Support model	All models
matters need attention	When the user custom character set is cancelled, the internal character set is automatically selected.
Use the example	not have

## Define a user-custom character set

Directive name	Define a user-custom character set
instruction code	ASCII : ESC & y c 1 c 2 [x 1 d 1 d (yx 1)] [xk d 1 d (y x k)]..... ...Decimal: 27 38 y c 1 c 2 [x 1 d 1 d (yx 1)]...[xk d 1 d (yxk )].. Hexdecimal: 1B 26 y c 1 c 2 [x 1 d 1...d (y x 1)]...[xk d 1...d(yxk)]
functional description	Define user-custom characters. The y specifies the number of vertical-orientation bytes. The c 1 specifies the start character encoding and the c 2 specifies the end character encoding. And xk specifies the number of horizontal direction points.
Parameter range	The range of the xy corresponds to the internal font If the font of 6 * 12, y= 2,0 x 6 If 12 * 24 fonts are selected, then y= 3,0 x 12 $32 \leq c1 \leq c2 \leq 126$ $0 \leq d1 d(y*xk) \leq 255$
Windows default	not have
Support model	All models

matters need  
attention

The range of defining character encoding: ASC II code from <20> H to <7E> H (95 characters). A continuous character encoding of multiple characters. When only one character is required when, make c1= c2. d

Is the point data of the character. The point pattern is the horizontal orientation starting from the left. The remaining points on the right are left blank.

The data that defines the user-defined character is the (y \* x) byte.

Set the corresponding bit of the print point to 1 or the corresponding bit of the no-print point to 0.

This command defines a different user-defined character pattern for each type. need ESC! Set the font type.

User-defined characters and lower bitmaps cannot be defined simultaneously. When the command is executed, the knockdown bitmap is cleared.

User-defined characters are cleared in the following situations :

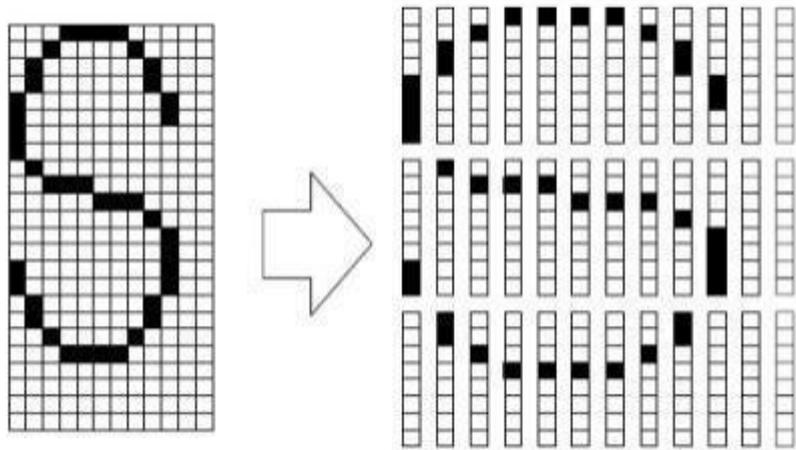

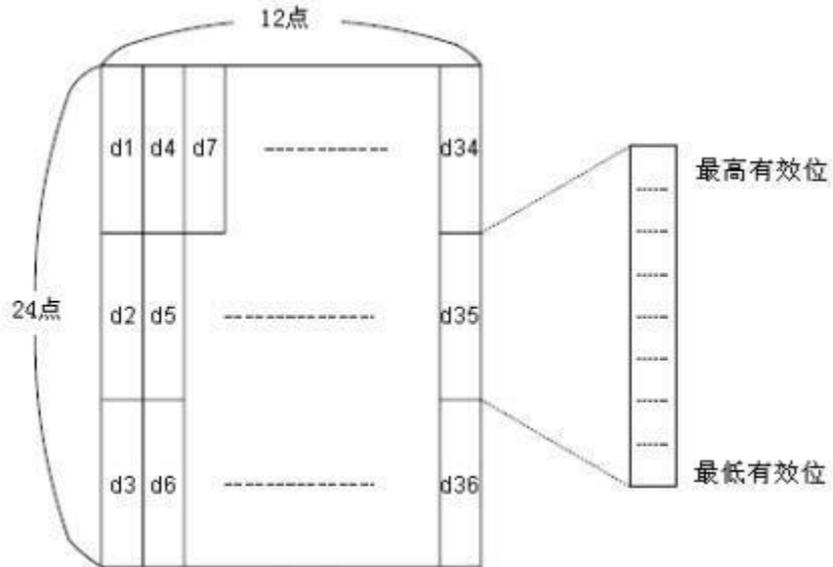

Execute the ESC @.

carry out GS\*.

Execute the ESC?.

The printer is reset or turned off in the power supply.  
 diagram:

When setting the type A (12 24).

d 1 = <0F>H    d 4 = <30>H    d 7 = <40>H    ....  
 d 2 = <03>H    d 5 = <80>H    d 8 = <40>H    ....  
 d 3 = <00>H    d 6 = <00>H    d 9 = <20>H    ....

Use the example

①y = 2  
 1B 40

## switch over the two-byte encoding

Directive name	Switch over the two-byte encoding
-------------------	-----------------------------------

instruction code	ASCII : ESC 9 n Decimal system: 2,756 n Hex-decimal system: 1B 39 n
functional description	The corresponding code of n is shown below: n code 0 GBK 1 UTF 8 2 reserved 3 BIG 5 4 SHIFT -JIS 5 EUC-KR
Parameter range	$0 \leq n \leq 5$
Windows default	0
Support model	Part of the model
matters need attention	The Chinese character mode should be enabled before use (1C 26 command can be enabled)
Use the example	1B 40 1C 26 1B 39 01

### ③ Drawing printing instructions

#### Figure vertical die-taking data filling

Directive name	Figure vertical die-taking data filling
instruction code	ASCII : ESC * m Hl Hh [d] k Decimal : 2,742 m Hl Hh [d] k Hex system: 1B 2A m Hl Hh [d] k
functional description	Print longitudinal die image data and the parameters are as follows: M. m is in a dot plot format: The m-mode horizontal scale is on a vertical scale 0 8-point single density 23 1 8-point double density 13 32 24-point single density 21 33 24-point double density 11 Hl and Hh are the points in the horizontal direction (Hl + 256 Hh) [d] k is the dot-plot data The k is used to indicate the number of dot plot data bytes and does not participate in transmission

Parameter range	<b>XX 58:</b> $m = 0, 1, 32, 33$ $1 \leq Hl + Hh \times 256 \leq 384$ $0 \leq d \leq 255$ $K = Hl + Hh \times 256$ (when $m = 0, 1$ )
--------------------	---

	<p><math>K = (Hl + Hh \ 256) \ 3</math> (when <math>m = 32,33</math>)</p> <p>XX 80:</p> <p><math>m = 0、1、32、33</math></p> <p><math>1 \leq Hl + Hh \times 256 \leq 576</math></p> <p><math>0 \leq d \leq 255</math></p> <p><math>K = Hl + Hh \ 256</math> (when <math>m = 0,1</math>)</p> <p><math>K = (Hl + Hh \ 256) \ 3</math> (when <math>m = 32,33</math>)</p>
Windows default	not have
Support model	All models
matters need attention	<p>[d] k, the corresponding bit is 1 indicates that the point is printed, the corresponding bit is 0, and the part of the horizontal direction of the image beyond the printed area will be ignored</p> <p>The relationship between the dot-plot data and the printing effect is as follows:</p> <div style="text-align: center;"> <p>The diagram illustrates the bit mapping for two modes: 8-point mode (8点方式) and 24-point mode (24点方式). In the 8-point mode, three data bytes (d1, d2, d3) are shown. Dashed lines indicate that the bits from these bytes are mapped to an 8-bit vertical stack, with the top four bits labeled '高位' (high bits) and the bottom four bits labeled '低位' (low bits). The 24-point mode shows three data bytes (d1-d3) mapped to a 24-bit vertical stack, with the top eight bits labeled '高位' and the bottom sixteen bits labeled '低位'.</p> </div> <p>This instruction only fills the print cache. The printing of the image starts after receiving the print instruction, and the print cache is emptied after the image is printed</p> <p>If the image to be printed is relatively high, it can be divided into several heights of 8 (<math>m =</math></p> <p>Images at points 0,1), or 24 (<math>m = 32,33</math>) are printed, respectively</p> <p>After filling graphics data, you can continue to fill other information so that the graphics is printed with other information</p> <p>After filling the point diagram, ESC J (<math>n = 24</math>) instruction is generally used to print, or LF instruction. However, the LF instruction to be printed will trigger the paper feeding operation (according to the line spacing), making the multiple lines of images discontinuous. The row spacing can be set to 0, then there will not be too much paper feeding. (The needle printer will start offset, if there is broken in the middle, please send data continuously)</p>

Use the example	<pre>1B 40 1b 2a 00 0C 00 FF 1B 33 00 0A</pre>
-----------------	--

## picture horizontal mold data printing

Directive name	Picture horizontal mold data printing
instruction code	<pre>ASCII : GS v 0 Decimal: 29 118 48 m xL xH yL yH [d] k</pre>

	Hex system: 1D 76 30 m xL xH yL yH [d] k
functional description	<p>Print the lateral die image data and the parameters are as follows :</p> <p>The m is the bitmap mode :</p> <p>The m-mode horizontal scale is on a vertical scale 0,48 Normal as described 11 1,49 x width 21 2,50-fold higher than 12 3,51, width and height 22</p> <p>The number of horizontal bytes is xL, xH (xL + xH 256) The number of yL and yH are vertical points (yL + yH 256) [d] k is the dot-plot data</p> <p>K is the number of dot plot data bytes, k is used for schematic, without transmission</p>
Parameter range	<p>XX 58:</p> <p><math>0 \leq m \leq 3 ; 48 \leq m \leq 51</math></p> <p><math>1 \leq xL + xH \times 256 \leq 48</math></p> <p><math>0 \leq yL \leq 255 , 0 \leq yH \leq 255</math></p> <p><math>0 \leq d \leq 255</math></p> <p><math>k = (Hl + Hh \times 256) \times (yL + yH \times 256)</math></p> <p>XX 80:</p> <p><math>0 \leq m \leq 3 ; 48 \leq m \leq 51</math></p> <p><math>1 \leq xL + xH \times 256 \leq 72</math></p> <p><math>0 \leq yL \leq 255 , 0 \leq yH \leq 255</math></p> <p><math>0 \leq d \leq 255</math></p> <p><math>k = (Hl + Hh \times 256) \times (yL + yH \times 256)</math></p>
Windows default	not have
Support model	All models
matters need attention	<p>The corresponding bit of [d] k is 1, which means that the point prints, and the corresponding bit is 0, which means that the point does not print. If the image level bytes exceed the print area, the excess part will be ignored</p> <p>When this instruction is executed, the paper is injected according to the size of the image, which is not affected by the row spacing setting of ESC 2 and ESC 3. After this instruction, the printing coordinate is reset to the left position and the image content is emptied</p> <p>The relationship between the bitmap data and the printing effect is as follows :</p>

## Define the lower bitmap

Directive name	Define the lower bitmap
instruction code	ASCII : GS * x y d 1...d (x * y * 8) Decimal: 29 42 x y d 1 d (xy 8)... Xhex system: 1D 2A x y d 1...d (x*y*8)
functional description	Specify the number of points with x and y to define the down bitmap. The x specifies the number of horizontal points as 8 * x. The y specifies the number of vertical direction points as 8 * y
Parameter range	$1 \leq x \leq 255$ $1 \leq y \leq 48$ $x * y \leq 1536$ $0 \leq d \leq 255$
Windows default	not have
Support model	All models
matters need attention	<p>If <math>x * y</math> exceeds the specified range, the order is prohibited. And d shows the bitmap data. Data (d) specifies that the print bit is 1 and the no-print bit is 0. Clear down bitmap definitions if:</p> <p>Execute the ESC @.</p> <p>Execute the ESC &amp;.</p> <p>The printer is reset or turned off in the power supply. The relationship between the bitmap and the printed data is shown in the following below</p>

## print the lower bitmap

Directive name	Print the lower bitmap										
instruction code	<pre>ASCII      : GS / m Decimal system: 2,947 m Hex-decimal system: 1D 2F m</pre>										
functional description	<p>Print the down bitmap in the mode specified by m</p> <table border="1"> <thead> <tr> <th>m</th> <th>pattern</th> </tr> </thead> <tbody> <tr> <td>0, 48</td> <td>common</td> </tr> <tr> <td>1, 49</td> <td>double width</td> </tr> <tr> <td>2, 50</td> <td>Times high</td> </tr> <tr> <td>3, 51</td> <td>Double width, double height</td> </tr> </tbody> </table>	m	pattern	0, 48	common	1, 49	double width	2, 50	Times high	3, 51	Double width, double height
m	pattern										
0, 48	common										
1, 49	double width										
2, 50	Times high										
3, 51	Double width, double height										
Parameter range	$0 \leq m \leq 3$ $48 \leq m \leq 51$										
Windows default	not have										
Support model	All models										
matters need attention	<p>If the bitmap data is not defined, the command is ignored.</p> <p>In standard mode, this command is only valid if there is no data in the print buffer.</p> <p>This command is invalid in print mode (bold, overlap, underlined, character size, or reverse white print), except in reverse print mode.</p> <p>If the lower bitmap to be printed exceeds the print area, the exceeded data is not printed.</p>										
Use the example	not have										

## Define the wbitmap

Directive name	Define the NV bitmap
instruction code	<pre>ASCII      : FS q n [xL xH yL yH d1...dk]1...[xL xH yL yH d1...dk]n Decimal: 28 113 n [xL xH yL yH d1...dk]1...[xL xH yL yH d1...dk]n Headecimal: 1C 71 n [xL xH yL yH d 1...dk]1...[xL xH yL yH d1...dk]n</pre>
functional description	<p>The NV bitmap is defined with specific values of n.</p> <p>N. Specifies the number of defined NV bitmaps.</p> <p>xL, xH the NV bitmap in the definition is <math>(xL + xH * 256) * 8</math>. The yL, yH specifies the number of vertical points for the NV bitmap in the definition as <math>(yL + yH * 256) * 8</math>.</p>

Parameter range	$1 \leq n \leq 255$ $0 \leq xL \leq 255$ $0 \leq xH \leq 3$ $(1 \leq (xL+xH*256) \leq 1023)$ $0 \leq yL \leq 255)$ $0 \leq yH \leq 1$ $(1 \leq (yL+yH*256) \leq 288)$ $0 \leq d \leq 255)$ $k = (xL +xH *256)*(yL+yH*256)*8$
--------------------	--

	And meter definition, of the data area = 64K bytes
Windows default	not have
Support model	All models
matters need attention	<p>Performing write commands frequently may damage the NV memory. Therefore, it is recommended to do no more than 10 writes on NV memory a day.</p> <p>After the process of placing an image into the NV memory, the printer performs a hardware reset operation. So the user custom character, the lower bitmap should be defined after the command. Printer clear</p> <p>Except the receive and print buffer and reset to the mode with power on. (Hardware reset interface is not supported)</p> <p>The command cancels all the NV bitmaps that are already defined with that command.</p> <p>From the start of this command to the completion of the hardware reset, mechanical operations cannot be performed (including the use of the feeding button to initialize the print head position when the cover plate is opened).</p> <p>During this command processing, the printer is busy and stops receiving data when writing data to the user NV memory. So the transfer of data, including real-time commands, is prohibited during the execution of this command.</p> <p>An NV bitmap is a bitmap defined in a non-volatile memory. The FSp printing was defined with the FSq.</p> <p>In standard mode, this command is valid only valid at the beginning of a row processing.</p> <p>The 7 bytes of the command &lt;FSyH&gt; are valid.</p> <p>When the amount of data exceeds the left capacity of the range defined by xL, xH, yL, yH, the printer will process the range defined by xL, xH, yL, yH outside the defined range.</p> <p>In the first set of bitmaps, when xL, xH, yL, yH</p> <p>If any parameter exceeds the definition of the range, the command is prohibited.</p> <p>In a set of bitmaps in the non-first group, when the printer encounters xL, xH, yL, yH</p> <p>When the defined range is exceeded, the command is stopped and writing the NV image begins. At this time, an undefined NV bitmap is prohibited (undefined,) but any previously defined NV bitmaps are still valid.</p> <p>The d represents the defined data. In the data (d)</p> <p>In, a 1 bit specifies a point to print and a 0 bit specifies a point that does not print.</p> <p>The command defines n as the number of NV bitmaps. Quantity from bitplot 01H</p>

This command only executes the definition of the NV bitmap, not the printing. The NV bitmap is printed by the FSp

Command execution of.

Figure : when  $xL = 64$ ,  $xH = 0$ ,  $yL = 96$ ,  $yH = 0$

## print the grating bitmap

Directive name				
instruction code	ASCII : GS v 0 m xL xH yL yH d1...dk Decimal: 29 118 48 m xL xH yL yH d 1...dk Xhex system: 1D 76 30 m xL xH yL yH d1...dk			
functional description	Print the grating bitmap and select the grating bitmap mode by the m value :			
	m	pattern	Longitudinal resolution (DPI)	Lateral resolution (DPI)
	0,48	normal	200	200
	1,49	double width	200	100
	2,50	Times high	100	200

	3,51	Double width, double height	100	100
Parameter range	<p>0 m 3 or 48 m 51</p> $0 \leq xL \leq 255$ $0 \leq xH \leq 255$ $0 \leq yL \leq 255$ $0 \leq d \leq 255$ $k = (xL + xH * 256) * (yL + yH * 256) \quad (k \neq 0)$			
Windows default	not have			
Support model	All models			
matters need attention	<p>The xL, xH represents the number of horizontal bitmap bytes (xL + xH * 256)</p> <p>The yL, yH represents the number of vertical bitmap points (yL + yH * 256)</p> <p>In standard mode, this command is valid only if there is no data in the printer buffer.</p> <p>Character amplification, bold, printing, double printing, inverted printing, underlining, black and white backdisplay are not valid for this command.</p> <p>The portion of the bitmap beyond the printed area is not printed.</p> <p>ESC, valid for the grating bitmap.</p> <p>During the macro definition, the command stops the macro definition and performs the command. The command is not a part of the macro definition.</p> <p>And d represents the bitmap data. The corresponding bit of each byte of 1 indicates that the print point, and 0 does not print the point.</p>			
Use the example	<p>When <math>xL + xH * 256 = 64</math></p>			

### Horizontal position print line segment (curve print command)

Directive name	Horizontal position print line segment (curve print command)
----------------	--

TCK837 Printer specifications

<p>instruction code</p>	<p>ASCII : GS 'n x lsL x leH x leL x leH xnsL xnsH xneL xneH...</p> <p>..Decimal system: 1D 27 n x lsL x leH x leL x leH.xnsL xnsH xneL xneH</p> <p>...Hex system: 29 39 n x lsL x leH x leL x leH xnsL xnsH xneL xneH</p>
<p>functional description</p>	<p>The print zoom is as follows : Each horizontal curve segment can be considered composed of these points of segment length 1. Print n row horizontal segment, continuous use of this command can print out the desired curve.</p>

The `xksL`: horizontal coordinate of K line ;

The `xksH`: the higher order horizontal coordinate of the starting point of the K line ;

The `xkeL`: the lower order horizontal coordinate of the end point of the K line ;

The `xkeH`: the end point of the K line ; the coordinate start position is usually to the left of the printed area. The minimum coordinate coordinate is (0,0), the maximum abscissa value is 383, the data of `xkeL + xke H * 256` lines can not be arranged in order within the specified range ; Char `SendStr [8]` ; Char `SendStr 2[16]` ; Float `i` ; Short `y 1, y 2, y1s, y2s` ;

// Print the Y-axis (one line)

#### ④ tabulation instructions

##### horizontal tabulation

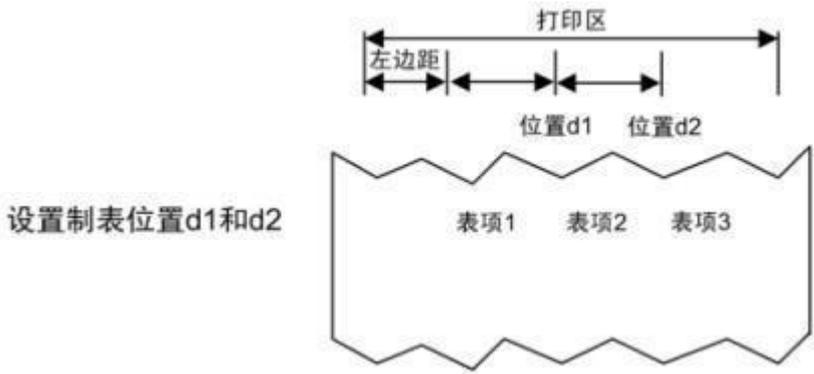

Directive name	horizontal tabulation
instruction code	ASCII : HT Decal : 9 Hex system : 09
functional description	Move the print position to the next tabulation position
Parameter range	not have
Windows default	not have
Support model	All models

matters need  
attention

The tabulation position is set by the ESC D  
If the tabulation position is not set (default no horizontal  
tabulation position), this instruction will be considered an LF  
instruction  
If the tabulation position exceeds the print area, the  
coordinates are moved to the starting position of the next  
line (if the bank data is full, print and

	line feed)
Use the example	not have

## set up the horizontal tabulation position

Directive name	
instruction code	ASCII : ESC D [d]k NUL Decimal system: 27 68 [d] k 0 Hex system: 1B 44 [d] k 00
functional description	Set the horizontal tabulation position, and the parameters are significant as follows: ...d 1 dk: Horizontal tabulation position in 8 points with NULL as the end character
Parameter range	XX 58 : $1 \leq d \leq 46$ ( $d_1 < d_2 < \dots < d_k$ , $1 \leq k \leq 16$ ) XX 80 : $1 \leq d \leq 70$ ( $d_1 < d_2 < \dots < d_k$ , $1 \leq k \leq 16$ )
Windows default	[d] k = 0 (default no level tabulation location)
Support model	All models
matters need attention	<p>The tabulation position is shown as follows:</p>  <p>设置制表位置d1和d2</p> <p>Up to 16 tabulation locations are supported Using this instruction cancels the setting of previous tabulation locations K for purposes, without transmission Transfer [d] k is considered to end when encountering a NULL If dk is less than or equal to dk-1, it is considered as the end, and the remaining data is considered as ordinary data processing tabulation position can be switched by HT When the left distance is changed, the tabulation position changes simultaneously When ESC @, printer reset, power failure, this instruction setting failure</p>

Use the example	<pre>1B 44 18 1E 00 46 4F 4F 44 09 50 52 49 43 45 09 49 44 0D0A0D0A 1B 44 18 1E 00 44 45 43 41 46 31 36 09 33 30 09 31 0D0A</pre>
-----------------	---

### ⑤ One-dimensional barcode printing instructions

set the one-dimensional barcode-readable character (HRI) print location

Directive name	Set the location of the barcode-readable character (HRI) printing
instruction code	<pre>ASCII : GS H n Decimal system: 2,972 n</pre>

	Hex-decimal system: 1D 48 n
functional description	Set the printing position of barcode readable character (HRI), and the n parameter is as follows: n            PP 0,           NOT print 48 1        Above the bar code , 49        Below the bar code 2,           Above and below the barcode 50 3, 51
Parameter range	0 n 3 or 48 n 51
Windows default	n = 0
Support model	All models
matters need attention	When ESC @, printer reset, power failure, this instruction setting failure
Use the example	not have

### set the one-dimensional barcode height

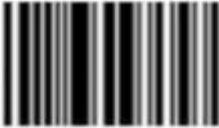

Directive name	Set the one-dimensional barcode height
instruction code	ASCII     : GS h n Decimal system: 29,104 n Hex-decimal system: 1D 68 n
functional description	Set the height of the barcode as n point, and the meaning of the parameter n is as follows:  高度为 50  高度为 100
Parameter range	$1 \leq n \leq 255$
Windows default	n = 64
Support model	All models
matters need attention	When ESC @, printer reset, power failure, this instruction setting failure
Use the example	not have

### sets the one-dimensional barcode width

Directive name	Sets the one-dimensional barcode width
----------------	--

TCK837 Printer specifications

instruction code	ASCII : GS w n Decimal system: 29,119 n Hex-decimal system: 1D 77 n
functional description	Set the barcode unit to n point, and the parameter n means as follows:

	 宽度为 3  宽度为 4
Parameter range	$1 \leq n \leq 6$
Windows default	$n = 2$
Support model	All models
matters need attention	When ESC @, printer reset, power failure, this instruction setting failure
Use the example	not have

### print a one-dimensional barcode

Directive name																	
instruction code	<p>(A) ASCII : GS k m [d]k NUL          Decimal: 29, 107 m [d] kNUL          Hex system: 1D 6B m [d] kNUL</p> <p>(B) ASCII : GS k m n [d]k          Decimal: 29, 107 mn [d] k          Hex system: 1D 6B m n [d] k</p>																
functional description	<p>Print the one-dimensional barcode, and the significance of each parameter is as follows:</p> <p>M. m is the encoding mode</p> <p>The n is the length of the coded data, only used in (B) mode. The difference between (A) and (B) instructions is the data segment of (A)</p> <p>End with the NULL character, and (B) indicates the length of the data</p> <p>[d] k is the barcode data</p> <p>K is the length of the barcode data, used for indication, without transmission</p> <p>The relationships between the parameters is shown in the following table:</p> <p>(instructA)</p> <table border="1" data-bbox="427 1861 1370 2067"> <thead> <tr> <th rowspan="2">m</th> <th rowspan="2">coding system</th> <th colspan="4">Barcode data (SP indicates spaces)</th> </tr> <tr> <th>DL</th> <th>k</th> <th>character set</th> <th>data (d)</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>UPC -A</td> <td>fixed</td> <td>k = 11, 12</td> <td>0~9</td> <td><math>48 \leq d \leq 57</math></td> </tr> </tbody> </table>	m	coding system	Barcode data (SP indicates spaces)				DL	k	character set	data (d)	0	UPC -A	fixed	k = 11, 12	0~9	$48 \leq d \leq 57$

Support model	All models					

matters need attention

If the barcode width exceeds the printable area, the printer does not perform the barcode printing

When this instruction is executed, it is not affected by the ESC 2 and ESC 3 line spacing setting or affect the line spacing setting

This instruction is not subject to the ESC! Character style setting impact

After this instruction is executed, the print position is returned to the print start position

Select the same coding system for m parameters 0 ~ 6 (A) and 65 ~ 71 (B), and when the printing effect is the same for m parameter 0 ~ 6 (A), the barcode data ends with NULL Barcode data for m parameters 65 to 74 (B) represents the data length as n

K is used for indication, and no transmission is required

When printing the UPCA (m = 0 or 65), note that:

Regardless of whether the length of the input data is 11 or 12

The character, middle separator, and end character are automatically inserted

When printing a UPCE (m = 1 or 66), note that:

When the data length is 6, the system character (NSC) 0 is automatically inserted automatically

When the data lengths are 7,8,11, and 12, the first digit system character (NSC) d1 must be 0

Whether the input data length is 6 or, 7,8,11, or 12

Whether the input data length is 6,7,8,11 or 12, the barcode readable character (HRI) can only display 6 bits of data, and does not contain the system character (NSC) and check code ;

The conversion relationship between transmitted data and printed data is as follows:

传输的数据										打印的数据					
d2	d3	d4	d5	d6	d7	d8	d9	d10	d11	d1	d2	d3	d4	d5	d6
0~9	0~9	0	0	0	-	-	0~9	0~9	0~9	d2	d3	d9	d10	d11	0
0~9	0~9	1	0	0	-	-	0~9	0~9	0~9	d2	d3	d9	d10	d11	1
0~9	0~9	2	0	0	-	-	0~9	0~9	0~9	d2	d3	d9	d10	d11	2
0~9	0~9	3~9	0	0	-	-	-	0~9	0~9	d2	d3	d4	d10	d11	3
0~9	0~9	0~9	1~9	0	-	-	-	-	0~9	d2	d3	d4	d5	d11	4
0~9	0~9	0~9	0~9	1~9	-	-	-	-	5~9	d2	d3	d4	d5	d6	d11

When d6 is 1 to 9, d7, d8, d9, d10 is 0, d11 is 5 to 9 start and end characters

When printing a EAN 13 (m = 2 or 67), note that :

Regardless of the length of the input data is 12 or 13  
The character, middle separator, and end character are automatically inserted

When printing a EAN 8 (m = 3 or 68), note that :

Regardless of whether the length of the input data is 7 or 8  
The character, middle separator, and end character are automatically inserted

When printing a CODE 39 (m = 4 or 69), note that :

When the d 1 or dn is not the start / end "\*", the encoder automatically inserts the "\*"

When "\*" is encountered in the middle of the data, the encoder regards it as the end character, and the rest of the data is regarded as ordinary data processing;

Checkout bits are not automatically calculated and added

When printing a ITF 25 (m = 5 or 70), note that :

Start characters and ends are automatically inserted

Checkout bits are not automatically calculated and added

When printing a CODABAR (NW-7) (m = 6 or 71), note that:

Start and end characters will not be automatically inserted and need to be manually added by the user, ranging from "A" ~ "D" or "A" ~ "d"

Checkout bits are not automatically calculated and added

When printing a CODE 93 (m = 72), note that :

Start characters and ends are automatically inserted

Two check codes are automatically calculated and inserted

When the barcode-readable characters (HRI) printing is set, you do not set any HRI characters representing the start / end

When setting barcode readable characters (HRI) printing, the control characters will be replaced with spaces when CODE 128 (m = 73) is selected :

Refer to Appendix A, COD E 128 for related information and character sets.

When using CODE 128, code with the following instructions:

- ① You must select the character set (one of CODE A, CODE B, and CODE C) before the barcode data.
- ② Select the character set by sending the character "{" combined with another character; the ASCII I code character "{" Complete by sending the character "{" twice continuously.  
Special characters send the data

## store the data of the QR code to the QR code buffer

Directive name	Store the data of the QR code to the QR code buffer		
instruction code	ASCII : GS ( k pL pH cn fn m d 1...dk Decimal: 29 40 107 pL pH cn fn m d 1...dk Hex system: 1D 28 6b pL pH cn fn m d 1...dk		
functional description	Store the data of the QR code to the QR code buffer		
Parameter range	$4 \leq (pL + pH \times 256) \leq 7092$ ( $0 \leq pL \leq 255, 0 \leq pH \leq 28$ ) cn =49 fn =80 m =48 $0 \leq d \leq 255$ $k = (pL + pH \times 256) - 3$		
Windows default	not have		

Support model	All models
matters need attention	Store the data of the QR code (d 1... And dk) to the QR code buffer zone. ((pL + pH 256) -3), with bytes in m (d 1... After dk) the data were processed as figures.
Use the example	not have

### Print the QR code

Directive name	Print the QR code
----------------	-------------------

instruction code	ASCII : GS ( k pL pH cn fn m Decimal: 29 40 107 pL pH cn fn m Hex-decimal system: 1D 28 6b pL pH cn fn m
functional description	Print the QR code
Parameter range	pL =3, pH =0 cn =49 fn =81 m =48
Windows default	not have
Support model	All models
matters need attention	Print the QR code. The user must consider the space of the QR code graphics (the spacing between the QR code graphics up and down and the left and right sides are specified in the specification).
Use the example	1b 40 1d 28 6b 03 00 31 43 03 1d 28 6b 03 00 31 45 30 1d 28 6b 06 00 31 50 30 41 42 43 1b 61 01 1d 28 6b 03 00 31 52 30 1d 28 6b 03 00 31 51 30

### set up the graphics information for the QR code

Directive name	Set up the graphics information for the QR code
instruction code	ASCII : GS ( k pL pH cn fn m Decimal: 29 40 107 pL pH cn fn m Hex-decimal system: 1D 28 6b pL pH cn fn m

functional  
description

Set up the graphics information for the QR code.  
Below are the specific details of the graphic information:

send data	hexadecimal	decimal system	data type
Header	37H	55	1byte
Flag	36H	54	1byte
Width	30H-39H	48-57	1-5byte
Separator	1FH	31	1byte
Height	30H-39H	48-57	1-5byte
Separator	1FH	31	1byte
Fixed Value	31H	49	1byte
Separator	1FH	31	1byte
Other Information	30H	48 or 49	1byte
	31H		
NUL	00H	0	1byte

Data sending for the width and height :

Points in units.  
Other information and data are sent :

	<p>"Hex =30H / decimal =48" means that the data is not printed.                  "Hex =31H / decimal =49" means that the data is not printed.</p>
Parameter range	<p>pL =3, pH =0                  cn =49                  fn =82                  m =48</p>
Windows default	not have
Support model	All models
matters need attention	<p>This command does not print the QR code drawing.                  The user must consider the space of the QR code graphics (the spacing between the QR code graphics up and down and the left and right sides are specified in the specification).</p>
Use the example	not have

### print QR code

Directive name	Print QR code
instruction code	<p>ASCII : GS k m v r nL nH d 1...dk                  Decimal: 29 107 97 v r nL nH d 1...dk                  Hex system: 1D 6B 61 v r nL nH d 1...dk</p>
functional description	<p>Print QR code                  V indicates the specification of QR code and v=0 indicates the specification of QR code                  And r indicates the error correction level                  nL nH Represents the data length                  d 1...The dk represents the QR code data to be printed</p>
Parameter range	<p><math>0 \leq v \leq 17</math>  <math>1 \leq r \leq 4</math>  <math>k = nL + 256 * nH</math></p>
Windows default	not have
Support model	Portable printer
matters need attention	Print the QR code.

	<p>Bits 2 and 3: When the sensor detects that the print paper is exhausted, the printer goes offline and the command is not executed. So bits 2 and 3 do not transmit the paper state.</p>																																			
Use the example	not have																																			

## Real-time transfer status

Directive name	Real-time transfer status
instruction code	<p>ASCII : DLE EOT n</p> <p>Decimal system: 16 4 n</p> <p>Hex system: 10 04 n</p>

TCK837 Printer specifications

functional description	<p>Transfer the printer status and parameters in real-time according to the following parameters</p> <p>To specify the printer status that you want to transfer:</p> <p>N = 1: Transfer the printer status</p> <p>N = 2: Transfer the offline status</p> <p>N. n = 3: Transfer the error state</p> <p>N = 4: transfer paper sensor status</p>	n
Parameter range	$1 \leq n \leq 4$	
Windows default	not have	
Support model	All models	

matters need attention

The printer receives the command  
 The command tries not to be inserted in a command sequence of 2 or more bytes.  
 The command is valid even if the printer is set as disabled by the ESC = (select peripheral) command.  
 The printer transmits the current state, and each state is represented by 1 byte of data.  
 The printer transfer status does not confirm if the host is received.  
 The printer receives the command and performs it immediately. •  
 This command is valid for a serial port printer. The printer receives the command immediately in any state

Support model	All models					

<p>matters need attention</p>	<p>If any of the state items in the above table is allowed, the printer loses the state when the command is executed. Once the Allow status item changes, the printer automatically transfers the status.</p> <p>Because each state transfer represents the current state, the prohibited state terms can be changed.</p> <p>If all the status items are banned, then the ASB function is also banned.</p> <p>If the will</p> <p>ASB is allowed as a default setting for the printer from the first time it can receive and transfer the printer data.</p> <p>Transfer the following four status bytes without determining whether the host is ready to receive the data. The four state bytes must be continuous, except for the XOFF code.</p> <p>Because command data is executed after processing in the receiving buffer, there may be a lag time between data reception and state transmission.</p> <p>When using the DLE EOT, you must distinguish between the states transmitted by these commands and the ASB state</p>
<p>Use the example</p>	<p>1D 61 08</p>

⑧ other instructions

Initialize the printer

<p>Directive name</p>	<p>Initialize the printer</p>
-----------------------	-------------------------------

instruction code	ASCII : ESC @ Decimal system: 2,764 Headecimal system: 1B 40
functional description	Initialize the printer with the following contents: Clear the print cache Each parameter recovers the default value
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	not have
Use the example	not have

### print self-test pages

Directive name	Print self-test pages
instruction code	ASCII : DC 2 T Decimal system: 1,894 Xx: 12 54
functional description	The printer prints a self-test page containing the program version of the printer, communication interface type, code page and some other data
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	not have
Use the example	1B 40 12 54

### set the print concentration

Directive name	Set the print concentration
instruction code	ASCII : ESC 7 n 1 n 2 n 3 Decimal system: 2,755 n 1 n 2 n 3 Hex-decimal system: 1B 37 n1 n2 n3

TCK837 Printer specifications

functional description	<p>Set the most heating point for printing, heating time, interval time:</p> <p>N 1 = 0-255 maximum heating points in unit (8dot s), default value of 9 (80 points) ;</p> <p>N 2 = 0-255 heating time in unit (10us), default value of 80;</p> <p>N 3 = 0-255 heating interval time, unit (10us), default value of 2;</p> <p>With many heating points, the maximum current consumption of the control board is large and the printing speed is fast. The maximum number of heating points is 8 (n1 + 1) ;</p> <p>The longer the heating time, the higher the printing black degree, and the slower the printing speed. If the heating time is too short, there may be a printed blank ;</p> <p>The longer the interval is, the clearer the printing is, and the printing speed becomes slower;</p>
Parameter range	
Windows default	not have
Support model	All models
matters need attention	The "Heating Time", "Heating interval" control board will automatically adjust according to the input voltage.

Use the example	<p>Heating points : 80 points, heating time: 800us, interval time of 200us.</p> <p>1B 40 1B 37 09 50 02 12 54</p> <p>Heating points : 80 points, heating time: 1600us, interval time of 200us.</p> <p>1B 40 1B 37 09 A 0 02 12 54</p> <p>As can be seen, after the prolonged heating time, the printing concentration becomes significantly black.</p>
-----------------	--

### select the cutting mode and cut the paper

Directive name	Select the cutting mode and cut the paper								
instruction code	<p>① ASCII : GS V m Decimal system: 2,986 m Hex-decimal system: 1D 56 m</p> <p>② ASCII : GS V m n Decimal system: 2,986 mn Hex-decimal system: 1D 56 m n</p>								
functional description	<p>Select a paper cutting mode and cut the paper. The cutting mode was selected based on the value of m as shown below</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%;">M</td> <td>Cut paper mode</td> </tr> <tr> <td>0, 48</td> <td>Full cut</td> </tr> <tr> <td>1, 49</td> <td>Half cut</td> </tr> <tr> <td>66</td> <td>Put paper in and cut paper</td> </tr> </table>	M	Cut paper mode	0, 48	Full cut	1, 49	Half cut	66	Put paper in and cut paper
M	Cut paper mode								
0, 48	Full cut								
1, 49	Half cut								
66	Put paper in and cut paper								
Parameter range	<p>① m = 0 , 48 , 1 , 49 ② m = 66 , 0 ≤ n ≤ 255</p>								
Windows default	not have								
Support model	All models								

TCK837 Printer specifications

<p>matters need attention</p>	<p>This order is valid only at the beginning.          And m = 0, 48, 1, 49, and the printer directly cut the paper.          When m = 66, the printer feeds [distance between print location and cutter + n (longitudinal moving unit)] and then cuts the paper.          The lateral and longitudinal moving units are set by the GSP command.          The paper volume was calculated using longitudinal moving units.</p>
<p>Use the example</p>	<p>1B 40          30 30 30 0D 0A          1D 56 00          30 30 30 0D 0A</p>

	1D 56 01 30 30 30 0D 0A 1D 56 42 00
--	---

### Fully cut paper form (OnlyForCut)

Directive name	Full cut paper
instruction code	ASCII : ESC i Decimal system: 27,105 Xadecimal : 1B 69
functional description	Select the cutter mode and cut it all
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	not have
Use the example	1B 40 30 30 30 0D 0A 1B 69

### Half-cut paper paper (OnlyForCut)

Directive name	Half cut paper
instruction code	ASCII : ESC m Decimal system: 27,109 Headecimal system : 1B 6D
functional description	Select the cutter mode and half cut
Parameter range	not have
Windows default	not have
Support model	All models
matters need attention	not have
Use the example	1B 40 30 30 30 0D 0A 1B 6D

### Generate a cassette pulse (OnlyForDrawer)

Directive name	Generate a wallet pulse
----------------	-------------------------

## TCK837 Printer specifications

instruction code	ASCII : ESC p m t1 t2 Decimal system: 27,112 m t1 t2 Hex-decimal system: 1B 70 m t1 t2
functional description	Output pulse (pulses specified by t1 and t2) to the pin specified by m
Parameter range	m =0,1,48,49 $0 \leq t1 \leq 255$ $0 \leq t2 \leq 255$
Windows default	not have
Support model	All models

matters need attention	1. The cassette pin is specified by m					
	<table border="1"> <thead> <tr> <th>m</th> <th>function</th> </tr> </thead> <tbody> <tr> <td>0,48</td> <td>Cassette open / off signal (connection pin 2)</td> </tr> <tr> <td>1,49</td> <td>Cassette open / off signal (connection pin 5)</td> </tr> </tbody> </table>	m	function	0,48	Cassette open / off signal (connection pin 2)	1,49
m	function					
0,48	Cassette open / off signal (connection pin 2)					
1,49	Cassette open / off signal (connection pin 5)					
	2, money box, open [t12ms], and closed [t22ms].					
	3, if t2 < t1, it is [t12m s].					
Use the example	<p>1B 40</p> <p>1B 70 00 60 60</p> <p>1B 70 01 60 60</p>					

### ⑨ page mode

#### print and return to standard mode (in page mode)

Directive name	Print and return to standard mode (in page mode)
instruction code	<p>ASCII : FF</p> <p>Decal: 12</p> <p>Hex-decimal system: 0C</p>
functional description	Print all the data in the print buffer in page mode and return to standard mode.
Parameter range	not have
Windows default	not have
Support model	80XXX
matters need attention	<p>After printing, clear the data from the buffer.</p> <p>The print area set by the ESC W is reset to the default setting.</p> <p>The printer does not perform the paper-cutting action.</p> <p>The command sets the print location as the starting point of the row.</p> <p>This command is valid only in the page mode.</p>
Use the example	not have

#### unprint the data in page mode

Directive name	Unprint the data in page mode
instruction code	<p>ASCII : CAN</p> <p>Decimal system: 24</p> <p>Xx system: 18</p>
functional description	In page mode, delete all print data in the current print area.
Parameter	not have

## TCK837 Printer specifications

range	
Windows default	not have
Support model	80XXX
matters need attention	This command is valid only in the page mode. If the previously set area overlaps with the current area, the overlap was also removed.
Use the example	not have

## print in page mode

Directive name	Print in page mode
instruction code	ASCII : ESC FF Decimal system: 2,712 Hex system: 1B 0C
functional description	In page mode, print everything in the buffer.
Parameter range	not have
Windows default	not have
Support model	80XXX
matters need attention	This command is valid only in the page mode. After printing, the contents, ESC T and ESC W settings and the location of characters class.
Use the example	not have

## select page Mode

Directive name	Select Page Mode
instruction code	ASCII : ESC L Decimal system: 2,776 Xhex system: 1B 4C
functional description	Convert from standard mode to page mode.
Parameter range	not have
Windows default	not have
Support model	80XXX

<p>matters need attention</p>	<p>This command is only valid at the header of the standard mode. In page mode, the command is invalid.</p> <p>When FF or ESC S, the printer returns to standard mode.</p> <p>This command sets the print location to the location determined by the ESC T command and the ESC W command.</p> <p>This command converts the settings for the following commands (in which values can be set separately in standard mode and page mode) to values in page mode:</p> <ol style="list-style-type: none"> <li>1. Set the character right spacing: ESC SP, FSS</li> <li>2. Set the row spacing: ESC 2, ESC 3</li> </ol> <p>The following command changes only flag bits in page mode and switches to standard mode.</p> <ol style="list-style-type: none"> <li>1. Turn clockwise for 90° : ESCV</li> <li>2. Select the alignment mode: ESCa</li> <li>3. Select the Inverted mode: ESC {</li> <li>4. Set the left margin: GSL</li> <li>5. Set the width of the printing area: GSW</li> </ol> <p>In page mode, ignore the following commands:</p> <ol style="list-style-type: none"> <li>1. Perform the test printing: GS (A</li> </ol> <p>The following commands are not available in the page mode:</p> <ol style="list-style-type: none"> <li>1. Print the NV bitmap: FSp</li> <li>2, define the NV bitmap: FSq</li> <li>3, write to the user NV memory: FS g 1</li> </ol>
-------------------------------	---

	4. Print the grating bit map: GS v 0 When the power is off, the printer is reset, or the E S C @ command is executed, the printer returns to standard mode.
Use the example	not have

### select the standard mode

Directive name	Select the standard mode
instruction code	ASCII : ESC S Decimal system: 2,783 Xhex system: 1B 53
functional description	Set up the standard mode
Parameter range	not have
Windows default	not have
Support model	80XXX
matters need attention	<p>This command is valid in the page mode. This command cleans up the page buffer to print the data. The command places the current position at the top of the line. The page mode area is initialized as the default value.</p> <p>This command converts the settings for the following commands to the values in the standard mode:</p> <ol style="list-style-type: none"> <li>1. Set the right spacing: ESC SP, FSS</li> <li>2. Select row spacing: ESC 2, ESC 3</li> </ol> <p>The following commands can set relevant parameters in standard mode but their set values enter page mode :</p> <ol style="list-style-type: none"> <li>1. Print area in setting page mode: ESCW</li> <li>2. Set the area direction in page mode: ESCT</li> </ol> <p>The following commands are ignored in standard mode:</p> <ol style="list-style-type: none"> <li>1. Set the vertical absolute printing position in page mode: G S \$</li> <li>2. Set the relative printing location in page mode: GS \</li> </ol> <p>After printer hardware reset or ESC @ command, the printer returns to standard mode.</p>
Use the example	not have

### select the print area direction in page mode

Directive name	Select the print area direction in page mode
instruction code	ASCII : ESC T n Decimal system: 2,784 n Hex-decimal system: 1B 54 n

functional description	Select the orientation and start position of the print area in page mode. N Specify the direction and starting location of the print area :
---------------------------	--

	<table border="1"> <thead> <tr> <th>n</th> <th>打印方向</th> <th>起始位置</th> </tr> </thead> <tbody> <tr> <td>0, 48</td> <td>由左到右</td> <td>左上 (图中A)</td> </tr> <tr> <td>1, 49</td> <td>由下到上</td> <td>左下 (图中B)</td> </tr> <tr> <td>2, 50</td> <td>由右到左</td> <td>右下 (图中C)</td> </tr> <tr> <td>3, 51</td> <td>由上到下</td> <td>右上 (图中D)</td> </tr> </tbody> </table>	n	打印方向	起始位置	0, 48	由左到右	左上 (图中A)	1, 49	由下到上	左下 (图中B)	2, 50	由右到左	右下 (图中C)	3, 51	由上到下	右上 (图中D)
n	打印方向	起始位置														
0, 48	由左到右	左上 (图中A)														
1, 49	由下到上	左下 (图中B)														
2, 50	由右到左	右下 (图中C)														
3, 51	由上到下	右上 (图中D)														
Parameter range	$0 \leq n \leq 3, 48 \leq n \leq 51$															
Windows default	$n = 0$															
Support model	80XXX															
matters need attention	<p>If the current mode is standard mode, only the internal flag bit does not affect printing.</p> <p>This command can set the start position of the print content in the print area.</p> <p>The use of lateral or longitudinal moving units also varies depending on the starting position of the area print:</p> <ol style="list-style-type: none"> <li>If the starting position of printing is the upper left or lower right corner of the printing area, then the arrangement direction of the printing content is perpendicular to the direction of the printing paper.</li> </ol> <p>The following commands use the lateral movement units: ESC SP, ESC \$, ESC \</p> <p>The following commands use longitudinal movement units: ESC 3, ESCJ, GS \$, GS \ 2. If the printer starts from the lower left or upper right corner of the print area, the print content is arranged in the same direction as the printer input paper.</p> <p>The following commands use the lateral movement units: ESC 3, ESCJ, GS \$, GS \</p> <p>The following commands use the longitudinal movement unit: ESC SP, ESC \$, ESC \</p>															
Use the example	not have															

## set up the print area in page mode

Directive name	Set up the print area in page mode
instruction code	<p>ASCII : ESC W xL xH yL yH dxL dxH dyL dyH</p> <p>Decimal system: 2, 787 xL xH yL yH dxL dxH dyL dyH</p> <p>Hex-decimal system: 1B 57 xL xH yL yH d xL dxH dyL dyH</p>

TCK837 Printer specifications

functional description	<p>Set area lateral start, longitudinal start, area width and height as follows :</p> <p>Transverse start position: <math>x_0 = [(xL + xH \ 256) \text{ lateral movement unit}]</math></p> <p>Longitudinal start position: <math>y_0 = [(yL + yH \ 256) \text{ longitudinal movement unit}]</math></p> <p>Print area width: <math>dx = [dxL + dxH \ 256] \text{ lateral movement unit}</math></p> <p>Print area height: <math>dy = [dyL + dyH \ 256] \text{ longitudinal move unit}</math></p>
Parameter range	<p><math>0 \leq (xL + xH \times 256) \leq 65535</math> (<math>0 \leq xL \leq 255, 0 \leq xH \leq 255</math>) <math>0 \leq (yL + yH \times 256) \leq 65535</math> (<math>0 \leq yL \leq 255, 0 \leq yH \leq 255</math>)</p> <p><math>1 \leq (dxL + dxH \times 256) \leq 65535</math> (<math>0 \leq dxL \leq 255, 0 \leq dxH \leq 255</math>) <math>1 \leq (dyL + dyH \times 256) \leq 65535</math> (<math>0 \leq dyL \leq 255, 0 \leq dyH \leq 255</math>)</p>
Windows default	<p><math>xL = xH = yL = yH = 0</math></p> <p><math>dxL = 72, dxH = 2, dyL = 176, dyH = 4</math></p>
Support model	<p>80XXX</p>
matters need attention	<p>This command sets only internal flag bits in standard mode and does not affect printing.</p>

	<p>If the lateral or longitudinal start is beyond the print area, the printer stops processing the command and the data is processed as normal data.</p> <p>If the width or height of the print area is set to 0, the printer stops processing the command, and the data is processed as normal data.</p> <p>This command works with the ESC T command to determine the current print location.</p> <p>If the value of the transverse start position + print area width exceeds the printable area, the width of the print area is automatically adjusted to, transverse printable width-Horizontal start position.</p> <p>If the value of the longitudinal start position + print area height exceeds the printable area, the height of the print area is automatically adjusted to the longitudinal printable height-Longitudinal start position.</p> <p>Horizontal and vertical moving units are specified by the GSP, and changing the horizontal and vertical moving units does not change the current print area.</p> <p>Horizontal start position and area width are set with lateral moving unit, and longitudinal start position and area height are set with longitudinal moving unit.</p> <p>Assuming that the lateral start position, longitudinal start position, print area width and print area height are X, Y, Dx, Dy, the settings of the print area are shown in the following figure :</p> 
Use the example	not have

## set the longitudinal absolute position in page mode

Directive name	Set the longitudinal absolute position in page mode
instruction code	<p>ASCII : GS \$ nL nH</p> <p>Decimal: 2,936 nLnH</p> <p>Hex-decimal system: 1D 24 nL nH</p>

TCK837 Printer specifications

functional description	<p>The absolute longitudinal position is set in page mode.</p> <p>This command sets the absolute position at [(nL + nH 256) (longitudinal or lateral units)] inches.</p>
Parameter range	$0 \leq nL \leq 255, 0 \leq nH \leq 255$
Windows default	-
Support model	80XXX
matters need attention	<p>This command is valid only in page mode.</p> <p>This command is ignored if [(nL + nH 256) (longitudinal or lateral units)] exceeds the set print area.</p> <p>Then the lateral position does not change.</p>

	<p>The reference location is set by the ESC T command.</p> <p>Depending on the orientation and starting location, the ESC T command causes the printer to do the following:</p> <p>① If the print start position is in the upper left or lower right corner, the command sets the absolute position in the direction parallel to the paper direction.</p> <p>② If the print start position is in the upper right or lower left corner, the command sets the absolute position in the direction perpendicular to the paper direction.</p> <p>Horizontal and longitudinal moving units are set by the GSP command.</p>
Use the example	not have

## set the longitudinal relative position in page mode

Directive name	Set the longitudinal relative position in page mode
instruction code	<p>ASCII : GS \nL nH</p> <p>Decimal: 2,992 nLnH</p> <p>Hex-decimal system: 1D 5C nL nH</p>
functional description	<p>In page mode, set the longitudinal movement distance with the current point as the reference point.</p> <p>This command sets the longitudinal movement distance to [(nL + nH 256) longitudinal or horizontally] inches relative to the current point.</p>
Parameter range	$0 \leq nL \leq 255, 0 \leq nH \leq 255$
Windows default	-
Support model	80XXX
matters need attention	<p>This command is valid only in page mode and is ignored in other modes.</p> <p>When the print position is moved down: <math>nL + nH 256 = N</math></p> <p>When the print position is moved up, use the complement calculation: <math>nL + n H 256 = 65536 - N</math> Any setting beyond the print area is ignored.</p> <p>This command determines the use of moving units according on the direction of the print area set by the ES C T:</p> <p>① Use the longitudinal move unit when the printing start position is set to the upper left (from left to right) or the lower right (from right to left).</p> <p>② Use the lateral movement unit when the printing start position is set to the upper right corner (the direction from top to bottom) or the lower left corner (the direction from bottom to top).</p> <p>Horizontal and longitudinal moving units are set by the GSP command.</p> <p>The GSP commands can change the lateral and longitudinal movement</p>

	of units.
Use the example	not have

## set up the lateral and longitudinal moving units

Directive name	Set up the lateral and longitudinal moving units
instruction code	ASCII : GS P x y Decal: 29 80 x y Hex-decimal system: 1D 50 x y
functional description	Set the lateral moving units approximately to 25.4/ xmm (1 / x inch) longitudinal moving units to 25.4/ ymm (1 / y inch), respectively. When x and y are 0, x and y are set to the default value.
Parameter range	$0 \leq x \leq 255, 0 \leq y \leq 255$
Windows default	At x = 200, y = 200, a moving unit is a print point. The lateral distance is approximately

	1 / 8mm, with a longitudinal distance of approximately 1 / 7mm.
Support model	80XXX
matters need attention	<p>The perpendicular to the paper direction is transverse and the paper direction is longitudinal.</p> <p>In the standard mode, the following command with x or y, even if the character rotation (inverted or clockwise rotation 90 ° does not change ;</p> <p>① Commands with x: ESC SP, ESC \$, ESC \, FSS, GSL, GSW</p> <p>② The command with y: ESC 3, ESCJ, GSV</p> <p>In page mode, apply x or y according to the area direction and the print start position:</p> <p>① When the print start position is set to the upper left corner (from left to right) or the lower right corner (from right to left) with the ESC T command : Command with x: ESC SP, ESC \$, ESCW, ESC \, FSS</p> <p>Commands with y: ESC 3, ESC J, ESC W, GS \$, GS \, GS V</p> <p>② When the printing start position is set to the upper right corner (printing direction from top to bottom) or the lower left corner (printing direction from bottom to top) with the ESC T command :</p> <p>Commands with x: ESC 3, ESCJ, ESCW, GS \$, GS \</p> <p>Command with y: ESC SP, ESC \$, ESCW, ESC \, FSS, GSV</p> <p>This command does not affect other previous settings.</p> <p>The smallest moving unit is the result of a combination of this and other commands.</p> <p>An inch equals the 25.4mm.</p>
